Information Assurance and Security 1
Laboratory #2

Role-Based Dashboards and Access Control

Objective
Implement **role-based access control** in your existing project by creating a separate dashboard for each user role identified in your **Project Proposal**.

Instructions
1. Use the **same user roles defined in your submitted Project Proposal**.
2. Create a **separate dashboard/interface for each user role**.
3. Configure the system so that users are redirected to the dashboard corresponding to their assigned role after login.
4. Implement **authorization** to ensure that users can access **only the dashboard and features permitted for their role**.
5. A user must not be able to access another role's dashboard by manually entering its URL or route.
6. Test the access control using accounts with different roles.

Expected Output
Your system must demonstrate:
- A **separate dashboard for each role** in your Project Proposal.
- Successful login redirects the user to the **dashboard assigned to their role**.
- Each role can access **only its authorized dashboard**.
- Just display the text like "Welcome Admin/User/Staff!" in the dashboard
- Unauthorized users are prevented from accessing another role's dashboard.
- Attempting to access an unauthorized dashboard results in an appropriate response, such as an **Access Denied**, **403 Forbidden**, or redirection to an authorized page.

Example
If the project proposal identifies these roles:

User Role	**Expected Dashboard**
Administrator	Administrator Dashboard
Staff	Staff Dashboard
Customer	Customer Dashboard

A user with the **Administrator** role must be redirected to the Administrator Dashboard after login and must not be allowed to access the Staff or Customer Dashboard.

IMPORTANT NOTE:
Please **print the second page on short/letter-size paper** and **bring the printed copy during the checking of your output**. The second page will be used as part of the activity verification.

Connection to IPT2
This activity uses the **role field and User Management Module implemented in Integrative Programming and Technologies 2**. The role stored for each user will determine which dashboard and system resources the user is authorized to access.

Information Assurance and Security 1
Activity: Role-Based Dashboards and Access Control
Name: _____
Year & Course/Section: _____
Date: _____

Scoring Rubric

Criteria	Description	Points	
Role-Based Dashboards	Creates a separate dashboard/interface for each user role specified in the project proposal.	20	
Login-Based Redirection	After login, the user is automatically redirected to the dashboard corresponding to their assigned role.	20	
Authorization	Users can access only the dashboard and resources authorized for their assigned role.	25	
Unauthorized Access Prevention	Users are prevented from accessing another role's dashboard, including through direct URL/route access.	20	
Dashboard Role Identification	Each dashboard clearly identifies the logged-in role (e.g., **"Welcome Admin!"**, **"Welcome Staff!"**, or **"Welcome User!"**).	5	
Testing & Demonstration	Demonstrates access using different user roles and shows both authorized and unauthorized access scenarios.	5	
Project Proposal Consistency	Uses the actual user roles identified in the submitted project proposal.	5	
Total		**100**	

Expected Demonstration
The student should demonstrate:
Login → Identify User Role → Redirect to Correct Dashboard → Allow Authorized Access → Block Unauthorized Access

User Roles from Your Project Proposal
Project Title: _____

No.	User Role from Project Proposal	Description / Responsibility
1	_____	_____
2	_____	_____
3	_____	_____
4	_____	_____
5	_____	_____

Reminder: Use only the user roles identified in your submitted Project Proposal. These roles will be used in the succeeding activities for **User Management, Role-Based Dashboards, and Access Control**.
